# CMPS 510 - Personal Portfolio Page:

## Software Engineering Project Report

CMPS 510 - Principles and Concepts of Software Engineering

**Gowtham Kanneganti**

Bay Atlantic University | Instructor: Dr. Tsige Tessema

## 01 Project overview

Project 7 is a responsive professional portfolio for a Robotics & AI Engineer. It presents supplied education, technical skills, a verified software-project description, and two engineering-experience summaries. Recruiters can explore the work and access GitHub, LinkedIn, and direct email links.

The application is a static HTML, CSS, and JavaScript page. It has no application server, database, authentication, or message delivery service. The demonstration form validates inputs and displays a truthful thank-you message. Only the theme preference is stored.

## 02 Five core user stories & acceptance criteria

### 1. Professional background

As a recruiter, I want to view the engineer's professional background so that I can assess relevance to a robotics role.

Acceptance: About shows the supplied background and all three education entries; the temporary portrait is visible and clearly labeled.

### 2. Projects and experience

As a hiring manager, I want to explore projects and engineering experience so that I can understand the engineer's practical focus.

Acceptance: Three cards are visible. MaintainAI links to its real repository; the other cards are explicitly labeled as experience.

### 3. Professional contact

As a collaborator, I want to access professional contact links so that I can start a real conversation.

Acceptance: GitHub and LinkedIn use the supplied URLs; the direct email link uses the supplied Outlook mailto address.

### 4. Demonstration form

As a visitor, I want to submit the demonstration contact form so that I can see clear feedback.

Acceptance: Blank fields and invalid email show field feedback. Valid input shows thanks and states that nothing was sent or stored.

### 5. Theme preference

As a visitor, I want to change between light and dark themes so that I can read in my preferred appearance.

Acceptance: The toggle changes the theme and accessible label; the choice survives reload when storage is available.

## 03 Application layout sketch

Wireframe prepared during implementation; matches the final section order.

**Header**
Wordmark | About / Work / Skills / Contact | Theme toggle

**Hero: introduction & links**
Name, role, work / contact actions

**Engineering illustration**
Conceptual robotic arm

**About + portrait placeholder**
Background, engineering focus, and three education entries

**MaintainAI**
Software project

**Server disassembly**
Engineering experience

**Vision & inspection**
Technical experience

**Technical skills**
Robotics | Automation | Software | Vision & AI

**Contact links**
Email | GitHub | LinkedIn

**Demonstration form**
Name | Email | Message | Feedback

**Footer: name, links, copyright**

Mobile: columns stack; navigation remains visible; section order is preserved.

## 04 Implementation & verification

Built locally on Windows in Codex Desktop. Semantic HTML, responsive CSS, pure validation/theme utilities, and DOM interaction code separate responsibilities. Node tooling validates and assembles the static site.

Executed: 22 unit tests and 13 Chrome checks passed; HTML/assets validated. Browser coverage includes forms, themes, keyboard access, reduced motion, mobile overflow and axe in both themes. Automated scans do not prove full accessibility.

Codex assisted with design, code, tests and documentation. A real photo and student review remain required. Deployment evidence: CHECKPOINT_SUMMARY.md.
